SURGICAL PATHOLOGY REPORT

Moshier, Donald
M 43 DOB 8/18/61
MR# 226525

Dr. Horsley/Beam
4447798 FC: 11
ROOM: OP

DATE OF OPERATION: 08-24-04
Received in Pathology: 08-24-04

PATHOLOGY NUMBER: S04-3048

PRE-OP DX: Elevated LFTS
PROCEDURE: CT Guided Needle Biopsy
CLINICAL INFORMATION:

SPECIMEN/LOCATION: CT Guided Needle Biopsy of Liver

GROSS DESCRIPTION: The specimen received in formalin consists of four tan-brown, linear soft tissue fragments, varying from 0.7 to 1 cm in length and 0.1 cm in diameter. The entire specimen is submitted.

MICROSTUDY DIAGNOSIS:

CT Guided Needle Biopsy of Liver:

Cirrhosis of liver, micro-nodular pattern, active. See comment.

COMMENT: Focally hepatocytes show mild to moderate micro and macrovesicular fatty degeneration with focal ballooned hepatocytes, focal areas of piecemeal necrosis. Special stains, trichrome, show increased fibrous tissue. Special stains for Iron do not show increased stainable Iron. The possible etiology includes among others the following: alcoholic cirrhosis, viral hepatitis with cirrhosis. Findings should be clinically correlated.

CT LIVER BIOPSY:

CT guided liver biopsy was performed. Before the examination started a CT of the entire abdomen was performed without contrast. The liver is in the upper limits of normal for size. The spleen is unremarkable. The gallbladder is normal. The kidneys are normal. The pancreas and adrenals are normal. Following this a CT guided biopsy was performed after an appropriate site was chosen. Subcutaneous Lidocaine was infiltrated into the soft tissues and two core biopsies were obtained. The liver had the consistency of wood. The patient tolerated the procedure without complications.
